Laminated PVC Striped Awning Tarpaulin Material for Sunshade

250D × 250D, 19 × 22, 0.35 mm laminated PVC striped tarpaulin fabric — waterproof, UV-resistant and weldable. Striped PVC tarpaulin material for tents, awnings, truck covers and sunshade applications. Custom colours and sizes available from our factory in China.

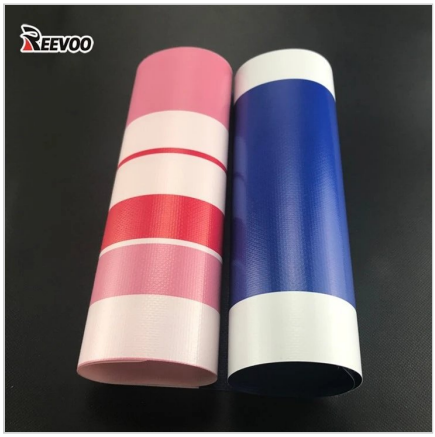

Product Introduction

REEVOO laminated PVC striped tarpaulin is designed for awnings, sunshades, market covers and other applications where the material remains visible as part of the finished structure.

The **250D × 250D woven base fabric and 0.35 mm laminated construction** keep the material relatively light and flexible, making it easier to fold, handle and fabricate than heavier industrial PVC tarpaulins. Striped colour combinations give finished awnings and covers a more distinctive appearance, while glossy, matt and semi-matt surface options allow the material to be matched to different product designs.

Technical Specification

Material	PVC-laminated polyester fabric
Art. No.	RV-LW2-035(2525)
Product	Laminated PVC Striped Awning Tarpaulin
Base Fabric	250D × 250D, 19 × 22
Thickness	0.35 mm

Width	Up to 3.2 m
Length	Standard roll length: 50 m; custom lengths available
Colour	Striped colours, blue, green and silver; custom colours available
Surface Finish	Glossy / Matt / Semi-matt
Weaving	Woven fabric
Service Life	9–18 months (depending on climate, UV exposure, installation and handling)
Optional Treatments	Flame retardant, UV resistant, anti-mildew
Fabrication	High-frequency welding available
Printing	Printable surface for logos and branding
Place of Origin	Zhejiang, China
Port of Loading	Shanghai or Ningbo
Shipping	By sea or air; FCL and LCL shipments available
Delivery Time	Approx. 25 days after receipt of payment and order confirmation
Payment Terms	T/T, L/C
MOQ	1,500 m
Packaging	Kraft paper packaging or paper tube packaging
Sample	Free material swatch available; sample lead time within 7 days

Why 250D Striped PVC Works for Awning Applications

Awnings and shade covers do not always require the weight and stiffness of a heavy-duty truck tarp. For products that are installed on frames, folded regularly or fabricated into medium-size panels, a lighter PVC construction can be easier to work with during cutting, welding, installation and storage. The 250D × 250D reinforcement provides structure inside the material, while the laminated PVC surface provides the waterproof layer required for outdoor shade and cover applications. At 0.35 mm, this construction is particularly suitable where handling and appearance are important alongside basic weather protection.

Why Use a Striped Surface Instead of a Solid Colour?

Striped tarpaulin is often selected for applications where the cover is visible to customers rather than hidden as a purely protective sheet. Shop awnings, market stalls, outdoor cafés, vendor canopies and patio shades often use stripe patterns to create a more distinctive finished appearance. Compared with relying entirely on printed graphics, striped base colours can provide a decorative look directly from the material itself. Different stripe combinations and colours can also be produced for different product lines, customer projects or regional market preferences.

Product Characteristics for Fabricators

This material is supplied as roll stock for conversion into finished covers and shade products. Key fabrication characteristics include: 0.35 mm construction for easier handling and folding · 250D × 250D woven polyester reinforcement · 50 m standard roll length · widths up to 3.2 m for larger awning and canopy panels · high-frequency welding available · printable surface for logos and graphics · glossy, matt and semi-matt finishes · striped and solid colour options · custom roll lengths available. The appropriate surface finish and fabrication method can be confirmed according to the finished product.

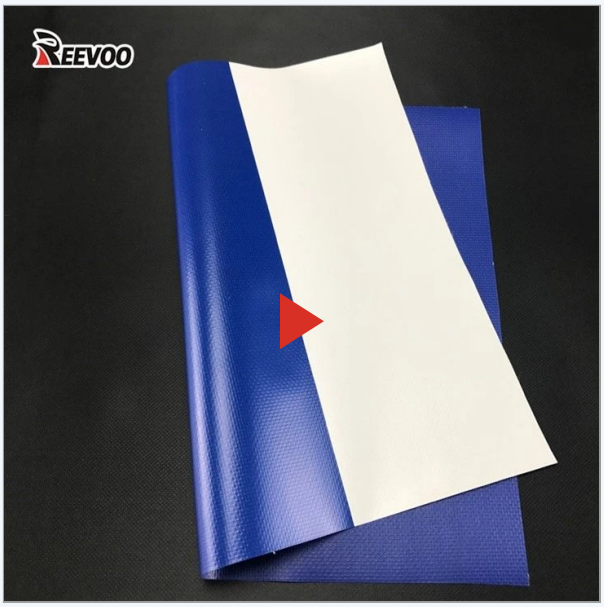

Low-Temperature Options for Cold Markets

For projects in Russia, Scandinavia, Canada and northern regions of the United States, the PVC formulation can be adjusted for improved low-temperature flexibility. Cold-resistant constructions can be developed for service temperatures below **−30 °C**. For more extreme winter conditions, please provide the lowest expected service temperature before production so the formulation can be confirmed accordingly.

Flame-Retardant Options

Flame-retardant formulations are available for projects with specific fire-performance requirements. **B1, B2 and M2 classifications** can be produced according to the specified test standard and required material construction. Because these classifications belong to different testing systems, buyers should provide the required standard at the enquiry stage so the appropriate formulation, construction and documentation can be confirmed before production.

Typical Applications

Storefront Awnings

Suitable for shopfronts, retail entrances and commercial shade structures where the cover forms part of the visible exterior. Striped patterns can give the finished awning a more recognisable appearance without requiring full-surface printing.

Market Stalls and Vendor Canopies

Well suited to outdoor markets, temporary sales areas and event booths where both weather protection and appearance matter. Different stripe colours can be selected to match branding or product categories.

Patio, Balcony Sunshades and Temporary Canopies

The lightweight laminated construction is easy to handle on fixed or retractable shade frames, for residential and commercial outdoor shade applications. Also suitable for seasonal shelters, promotional structures and other temporary covers that need a flexible waterproof material.

Outdoor Service Life

Typical service life is **9–18 months**, depending on climate, UV exposure, installation, frequency of handling and actual operating conditions. UV-resistant and anti-mildew treatments are available where improved outdoor performance is required. For projects in unusually cold climates, low-temperature PVC formulations can be selected separately according to the required service temperature.

FAQ

Is 250D PVC tarpaulin suitable for awnings?

Yes. The 250D × 250D construction is suitable for awnings and shade covers where lower material weight, flexibility and easier handling are preferred over a heavier industrial tarp construction. The final material specification should still be selected according to awning size, installation method and outdoor exposure.

Can striped PVC tarpaulin be produced in custom colour combinations?

Yes. Different stripe patterns and colour combinations can be produced according to order requirements. Solid colours are also available, together with glossy, matt and semi-matt surface finishes.

Can this material be used in cold climates?

Yes. For colder markets, the PVC formulation can be adjusted for improved flexibility at temperatures below −30 °C. Please provide the lowest expected service temperature when enquiring so the appropriate formulation can be confirmed before production.

Send Your Enquiry

Send us your required width, roll length, stripe colour, quantity, application and operating temperature range. Free material swatches are available for checking colour, surface finish and material construction before bulk production.
